

Medical Report Summary

Here's a summary of your recent general health check-up report in simple language:

To: Gokul Prasad (21 years, Male)

From: Dr. R. Subramaniam / City Health Diagnostics

Date of Report: August 4, 2024

Hello Gokul,

This is a summary of your recent health check-up. Overall, your report highlights several areas that need attention, but most of these can be managed well with some changes to your lifestyle and certain supplements.

Here's a breakdown of the key findings:

1. Blood & Energy Levels (Anaemia):

Your hemoglobin, red blood cell count, and haematocrit (PCV) are all a bit low. This indicates you have mild anaemia, which can make you feel tired.

This is likely connected to your low levels of Vitamin D and Vitamin B12, both of which are crucial for energy, blood health, and overall well-being.

2. Inflammation:

Your ESR and CRP levels are high, which suggests there might be a low-grade inflammation somewhere in your body.

3. Blood Sugar & Diabetes Risk:

Your Fasting Blood Glucose (sugar) and HbA1c levels are both slightly above normal (borderline). This means you are in a pre-diabetic state, indicating a higher risk of developing type 2 diabetes if not addressed.

4. Cholesterol & Heart Health:

Your Total Cholesterol, 'bad' LDL Cholesterol, and Triglycerides (other fats in your blood) are all a bit high.

Your 'good' HDL Cholesterol is slightly low. This combination is called dyslipidaemia, and it means you have an unhealthy fat balance that can affect your heart health over time.

5. Liver Health:

Your liver enzyme levels (SGPT and SGOT) are slightly elevated. This can sometimes be a sign of stress on your liver.

6. Blood Pressure & Weight:

Your blood pressure is slightly elevated (128/84 mmHg).

Your BMI (Body Mass Index) is also a little high (26.1 kg/m²), suggesting you are in the overweight range.

7. Other Notes:

Your urine test showed it was slightly cloudy and had a trace amount of protein. These are minor findings but have been noted.

Most of your other vital signs (pulse, temperature, breathing, oxygen levels) and other blood tests (platelets, kidney function) are normal.

Dr. Subramaniam's Recommendations (What You Should Do Next):

Based on these findings, your doctor recommends the following important steps:

* **Supplements:** Start taking **Vitamin D3 supplements (60,000 IU weekly for 8 weeks)** and **Vitamin B12 supplements** to correct these deficiencies.

* **Diet Changes:**

* Switch to a **low-glycaemic diet** (focus on foods that don't cause quick spikes in blood sugar, like whole grains, vegetables, and lean proteins).

* **Reduce your sodium (salt) intake.**

* **Avoid alcohol and fatty foods** to help your liver.

* **Exercise:** Get **moderate aerobic exercise** for at least 30 minutes every day.

* **Monitoring:** Regularly **monitor your blood pressure** at home or with your doctor.

* **Follow-up:** It's important to **schedule another visit with your doctor in 6 to 8 weeks** to review your progress and re-check some of these values.

Please discuss these results and recommendations directly with Dr. Subramaniam to create a personalized plan for your health.
